

Bruno Ortiz Blanco

Software Developer

Gijón, Spain · info@brunob.dev · brunob.dev · github.com/ibrunob · linkedin.com/in/brunob-dev

Full-stack developer who ships things people actually use. Built a League of Legends scenario tool that took **40,000 visitors and 1.5M requests** in 48 hours while broadcast live on Twitch, and wrote a university lab's sensor platform end to end: PHP API, React dashboard, C++ firmware. Works across both sides of AI: computer-vision and NLP pipelines of my own, and LLM-backed products with agent orchestration and guardrails.

EXPERIENCE

Programmer · MediaLab, University of Oviedo Jan 2026 – Mar 2026

- Built most of **SensorLab**, the lab's sensor platform: a PHP REST API and a React + TypeScript dashboard, covering session authentication, organisation-scoped access control and a three-tier role system.
- Shipped the dashboard as a draggable widget grid: Recharts time series, Leaflet heatmaps over the sensor map, jsPDF report export. The same front end became the base for the lab's panic-button platform. Also wrote the C++ firmware for a LoRa air-quality station.

Junior Application Developer · Omnia 7D / MANTOTAL Mar 2025 – Jul 2025

- Built an Android app for field employees wired to the company intranet, database and FTP server (Java, PHP, MySQL).
- Built a Python machine-learning tool recognising buildings, doorways and kerb ramps in 360° Insta360 footage, and designed the relational database for the Cáceres city council GIS project.

SELECTED PROJECTS

LEC final-matchday scenario visualiser · personal project 2026

- Interactive view of all **4,096 possible outcomes** of the final League of Legends European Championship matchday. Used live on stream by Ibai, Caedrel and LoL Esports: **40,000+ unique visitors, 1.5M+ requests and 10,000+ concurrent users** at peak, responses under two seconds, no downtime.

dupay.lol · personal project, in progress 2026

- A demand market where people declare what they would pay for products that do not exist yet, ranking ideas by willingness to pay. Submissions are open with no account, so every entry passes model-backed moderation and validation before publication. Next.js on Vercel.

Chest X-ray anonymisation · TREE AIBiomed Hackathon, Treelogic 2026

- Removes patient data burned into radiograph pixels, where stripping DICOM metadata cannot reach it: YOLOv8 text detection, Tesseract OCR and spaCy NER to classify protected health information, served over FastAPI in Docker. **F1 of 0.929** with every non-PHI region preserved, on CPU alone.

DevLog AI · personal project 2026

- Turns GitHub commits into structured engineering logs through the OpenAI API. Connects over GitHub OAuth and sanitises diffs before they reach the model, keeping secrets out of the prompt and tokens encrypted at rest.

EDUCATION

BSc Computer Science · Escuela Politécnica de Ingeniería, University of Oviedo 2026 – present

Higher Diploma, Multiplatform Application Development · CIFP La Laboral 2024 – 2026

- Graduated **top of cohort** with a 9.35.
- SpainSkills Web Development:** regional champion for Asturias (2025), then **15th nationally** (2026).

TECHNICAL SKILLS

Languages	TypeScript, JavaScript, Java, Kotlin, Python, PHP, C++, SQL
Frontend	React, Next.js, Vite, Tailwind CSS, TanStack Query, Recharts, Leaflet
Backend & data	Node.js, Spring Boot, Laravel, FastAPI, PostgreSQL (Neon, Supabase), MySQL, MongoDB, Prisma
LLM engineering	LLM provider APIs, agents and multi-step orchestration, guardrails and content moderation
Machine learning	Computer vision (YOLOv8, custom dataset training), NER (spaCy), OCR (Tesseract), time-series forecasting (Markov, ETS), NumPy, Pandas, Matplotlib
Mobile & tooling	Android (Jetpack Compose), React Native, Git, GitHub Actions, Docker, Vercel, Figma
Spoken	Spanish (native) · English (C1)
